FORAGE SUITABILITY GROUP STEEP LOAM

FSG No.: G055BY109ND

Major Land Resource Area: 55B - Central Black Glaciated Plains

Physiographic Features

The soils in this group are located on strongly sloping upland positions of till plains and moraines.

| | <u>Minimum</u> | <u>Maximum</u> |

Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes. Annual precipitation varies widely from year to year in MLRA 55B. Average annual precipitation for all climate stations listed below is about 19 inches. About 78 percent of that occurs during the months of April through September. On average, there are about 28 days with greater than .1 inches of precipitation during the same timeframe. Precipitation is lowest in the northwest, and highest in the south in the MLRA. Precipitation is less than needed for optimum forage production and is the single largest factor limiting production from this group on non-irrigated lands.

Average annual snowfall ranges from 25 inches at Forman, North Dakota (ND), to 37 inches at Columbia, South Dakota (SD). Snow cover at depths greater than 1-inch range from 32 days at Petersburg, ND, to 98 days at Gackle, ND.

Average July temperatures are about 71°F and average January temperatures are about 7°F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -39 at both Petersburg and Oakes in ND, and a high of 114 recorded at Mellette, SD. The MLRA lies in USDA Plant Hardiness Zones 3b and 4a.

At Aberdeen, SD, the average annual wind speeds are about 11 mph. The highest wind speeds occur during March through May, but average monthly wind speeds do not vary significantly throughout the year. It is cloudy about 163 days a year. Average morning relative humidity in June is about 85 percent and average afternoon humidity is 60 percent.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data, access the National Water and Climate Center at http://www.wcc.nrcs.usda.gov.

Soil Interpretations

This group consists of well drained, moderate textured soils formed mostly in glacial till or alluvium. Available water capacity is high and permeability is moderately slow to moderate.

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed on the web at http://plants.usda.gov/.

| Cool Season Grasses | | Legumes | |
|-------------------------|---|----------------------|---|
| Altai wildrye | F | Alfalfa | G |
| Canada wildrye | F | American vetch | F |
| Crested wheatgrass | G | Birdsfoot trefoil | F |
| Green needlegrass | G | Canada milkvetch | F |
| Intermediate wheatgrass | G | Cicer milkvetch | G |
| Meadow bromegrass | G | Purple prairieclover | G |
| Newhy hybrid wheatgrass | G | Red clover | F |
| Pubescent wheatgrass | G | Sainfoin | F |
| Russian wildrye | G | Sweetclover | G |
| Slender wheatgrass | G | White prairieclover | G |
| Smooth bromegrass | G | | |
| Tall wheatgrass | G | | |
| Western wheatgrass | G | | |
| Warm Season Grasses | | | |
| Big bluestem | F | | |
| Blue grama | G | | |
| Indiangrass | F | | |
| Little bluestem | G | | |
| Prairie sandreed | F | | |
| Sand bluestem | F | | |
| Sideoats grama | G | | |
| Switchgrass | F | | |

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

| Forage Crop | Management Intensity | | | | |
|---------------------------------|----------------------|---------|--|--|--|
| | <u>High</u> | Low | | | |
| | (lbs/ac | (lbs/ac | | | |
| Alfalfa | 7100 | 3100 | | | |
| Alfalfa/Crested wheatgrass | 5100 | 2400 | | | |
| Alfalfa/Intermediate wheatgrass | 5400 | 2700 | | | |

| Western wheatgrass | 3400 | 1600 | | | |

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Soil Limitations

The slope of these soils range from 15 to 30 percent with high and very high runoff potential, resulting in less of the water entering the soil and being available for plant growth. The potential for water erosion on these steep slopes is high when establishing new stands or renovating stands, and in thin existing stands with exposed bare ground. Livestock trail erosion can be a severe problem. Also, the steep slopes can result in uneven grazing by livestock, and makes travel with wheeled vehicles dangerous.

Management Interpretations

Including sod forming grass species in new seedings will reduce the potential for sheet and rill erosion. Incorporate erosion control practices during the establishment period. Locate facilitating practices such as fences, lanes, and water developments to control livestock movement to more evenly distribute grazing and reduce livestock trailing perpendicular to steeper slopes.

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.
